

FLEXIBLE
CONNECTORS &
BUS BAR SYSTEMS

WITH CONCURRENT MECHANICAL FLEXIBILITY, FLOHE EXPANSION CONNECTORS SERVE TO COMPENSATE VIBRATION

BETWEEN SWITCHES, TRANSFORMERS, HIGH VOLTAGE COMPONENTS AND THEIR RIGID BUS BAR

In contrast to a rigid connection, they compensate switching impulses, vibrations or, in the case of expansion as a result of current heat, mechanical changes. There are various manufacturing technologies available for each application case. At the same time, a rough distinction is made between expansion connectors made from foil and braid.

If you require a special embodiment for your constructive solutions, FLOHE's in-house designers will implement and produce the right connector for you.

A WIDE RANGE OF SHAPES

THE MAIN POINTS...

WHEN DEVELOPING AN EXTENSION CONNECTOR ARE THE CURRENT RATING, FLOW OF THE CURRENT, THE CONNECTION MATERIAL, FLEXIBILITY AND THE INSTALLATION CONDITIONS.

The equipment to be connected determines the choice of material. A copper expansion connector is used in the case of connections between copper bus bars. Aluminium expansion connectors are used for aluminium bus bars.

If an aluminium bus bar is to be connected to a copper connection however, there are several design variants. Pressure welding, gas-shielded arc welding, explosive plating or screwing onto a Cupal bimetallic plate. Alternatively, there is surface treatment, such as silver, nickel, tin or copper plating.

Current levels have the greatest impact with respect to the cross section. In addition, voltage drops, power dissipation and operating temperatures also have an influence. 50 °C - 60 °C is an optimum operating temperature. Depending on the path ('l'), the flexibility of a connector is defined in one direction by the required force ('F').

Another defining measure of the flexibility of the connector is its torsional stiffness, i.e. the size of the torque at which a defined angle or twist is achieved.

FLOHE offers a wide and differentiated product range with flexible connections in the field of high voltage technology. We create expansion connectors using different materials and different production technologies.

Our portfolio is rounded off by our installation department. From on site welding through to the provision of a supervisor, it's all in our range of services. We are happy to manage the installation of complete systems.

PRESSURE WELDING...

USING THE TECHNOLOGY OF PRESSURE WELDING, COPPER FOILS OF DIFFERENT THICKNESSES ARE WELDED TOGETHER.

An electrical current (up to 65000 Ampere at approx. 15 Volt) passes through pressed on electrodes and the component. The copper foils to be welded are heated until just short of the melting point and then fused together by pressing, wherein the lattice planes of the of the materials come together as a result of the deformation (up to atomic effect displacements) and as such, generate the material bonding. Press welding has a great importance as, apart from high productivity, qualitatively-good weld connections are generated.

Pressure welded expansion connectors from FLOHE exhibit exceptional conductivity on account of a fully molecular composition. The contact surfaces can be drilled, milled and bent.

TYPE FKD

EXPANSION CONNECTORS
MADE FROM COPPER
IN A PRESSURE WELDED EMBODIMENT

- HIGH ELASTICITY
- GOOD CONDUCTABILITY
- THICKNESS CAN BE FREELY SELECTED

TECHNICAL DATA...

■ MATERIAL:

Cu-HCP foils (formerly SE-Cu) in accordance with DIN EN 13599 · Other thicknesses are available according to your specifications

With cover sheets, upon request

■ INSTALLATION NOTES:

If the embodiment A or B expansion connectors are installed on top of each other 5 mm thick, please make sure when installing that the small radius of one bent arc is placed into the large radius of the other bent arc.

FKD	
Width	28, 38, 48, 58, 78, 98, 118 ... 200
Thickness	4 ... 65
Foil thickness	0,04 ... 0,5
L ₁ /L ₂	10 ... 200
A	50 ... 2000
Drill pattern	In accordance with DIN 43673 and DIN 46276 parts 1 + 2
Drill diameter	4 ... 30
Expanded part	A, B, C
Contact surfaces	Bare, tin plated, silver plated

NOTE: Other dimensions and shapes are available on request.

TECHNICAL DATA...

- MATERIAL:
Cu-HCP foils (formerly SE-Cu) in accordance with DIN EN 13599
Upon request, the length, width and sheet thickness can be changed
- CONTACT ENDS:
Welded on flat copper, Cu-HCP in accordance with DIN

A HIGH DEGREE OF ADAPTABILITY TO DIFFERENT INSTALLATION CONDITIONS IS ACHIEVED...

through the combination of fixed and flexible components and as such, adherence to the planned overall installation period is assured.

Neither changes to the alignment nor compensation of the set-up tolerances of the switchgear lead to significant installation delays.

IN THE MANUFACTURING OF OUR HIGHLY DEVELOPED BUS BAR SYSTEMS...

FLOHE HOCHSTROMTECHNIK HAS MANY YEARS OF EXPERIENCE IN THE FOLLOWING SECTORS:

- MIG and TIG welding
- Press welding
- Working with explosive-plated sheeting
- Aluminium welding
- Hard soldering
- Processing of surfaces

AT ALL STAGES IN THE ENGINEERING PHASE ...

there is a person who is both responsible for the project and on hand to offer the customer advice and guidance. Professional installation by our supervisor rounds the project off and steers the customer onto the path of successful operation

BUS BAR SYSTEMS (UP TO 360kA)

OVER 60 YEARS OF INNOVATIVE EXPERTISE

IN THE FIELDS OF ENGINEERING AND MANUFACTURING AS WELL AS THE INSTALLATION OF CUSTOMISED BUS BARS – NATURALLY IN ACCORDANCE WITH ISO 14001 + OHSAS 18001

The systems are either carried out in accordance with customer drawings or completed as a turnkey project and are specially designed for the connection from the power generator to the loads.

AT FLOHE HOCHSTROMTECHNIK, OPERATIONAL SAFETY TAKES CENTRE STAGE.

The conductor spacings are designed for a high short-circuit resistance and determined by the holder. Optionally, depending on the customer's wishes, the bus bar holders are made from galvanised steel or stainless steel with an insulating plate. The thickness of the insulation plate directly depends on the operating voltage. As a result of this design, there is a high thermal and mechanical reliability.

When processing customer orders, design data is transmitted directly from the CAD workstations to the respective CNC machine in the integrated production lines. As a result of the optimally used manufacturing control, the total processing time is shortened considerably.

When in-house manufacturing capacity is fully utilised, we have a network of partner companies available. Of course, all foreign manufactured components are tested by our incoming goods inspection office and quality assurance department.

BUS BAR SYSTEMS (UP TO 360kA)

OUR RANGE OF PRODUCTS AND SERVICES INCLUDE :

BUS BARS MADE FROM COPPER AND ALUMINIUM WITH CURRENT RATINGS OF UP TO 360 kA

In addition, our products and services range from engineering and delivery / installation through to commissioning.

Furthermore, we offer the whole range of products and services, beginning with bus bars, the corresponding isolated mounts, flexible expansion connectors through to isolators.

**Innovative
ENGINEERING**
of complex systems
for over 60 years

▶ THE PHOTOGRAPHS UNDERNEATH REPRESENT STANDARDISED FIGURES FOR BEARING AND MOUNTING BUS BARS

▶ TYPE FRG-M-CC-30-MOT

▶ ISOLATORS

Apart from the FRG isolator, we also offer the FRGL disconnecter and the VAC short circuiter with a capsuled vacuum contact

■ For laying copper bus bars, the holders receive a special protective covering.

Bus bars which are suitable for insulated support groups A, B and C.

▶ Type FS

▶ Type FL

SELECTION OF THE CORRECT EMBODIMENT...

- EMBODIMENT 'N' for clamping onto short bars, which should stand securely in the holder.
- EMBODIMENT 'M' for time saving installation!
ADVANTAGES...
 1. The bottom part of the holder is fastened with the stud bolts before installation on the insulation support.
 2. Simple insertion of the bars between the stud bolts when installing.
 3. Application possibility for bars, which should stand securely in the holder through tightening the nuts. This also applies to long bars which, due to the heat expansion, have to stand sliding against each other in the holder by tightening the nuts..

- EMBODIMENT 'ML' for the sliding suspension of long bars.
Contrary to embodiment M, the clamping section (upper part of holder) does not lie on the bars but on the bolts.

ALSO SUPPLIED AS FOR 1 BUS BAR AND/OR 3 OR 5 BUS BARS

Embodiment 'N' with hexagonal head screws (normal)
Embodiment 'M' with stud bolts
Embodiment 'ML' with strengthened stud bolts

*) upon request, for countersunk screws M10, M12 and M16

CONNECTION PIECES AND LINKS MADE FROM FLEXIBLE COPPER EXPANSION CONNECTOR

THE CONNECTION PIECES AND LINKS ARE MAINLY INSTALLED WHERE A GREAT DEGREE OF FLEXIBILITY IS NECESSARY, AND/OR WHERE THERE ARE 2 LEVELS OF MOVEMENT.

- In general, our connectors are pressed on the ends with the contact sleeves and not, as is often seen in practice, soldered.
- The press procedure has the advantage that materials with the same composition and same conductance are joined together, something that with tin, when it is also used, is not the case.
- The cross section in mm stated by us in the summary of types is the real conductor cross section (single wire – cross section times number of wires). The connection – cross section 'B x connection thickness' never corresponds to the conductor cross-section.
- Upon request, the connection pieces and links can be clad with a protective hose.
- Load table for copper strand and copper strand connectors when heated from 35 °C to 70 °C

THE FOLLOWING FIGURES ARE NON-BINDING GUIDELINE VALUES.

If several connectors in parallel are used for each phase, it is necessary to reduce the load values.

Nominal cross section mm ²	Load in Ampere

The max. current load depends on the environmental conditions - The values do not apply to non-clad connectors

TYPE FH

EXPANSION CONNECTOR MADE FROM HIGHLY FLEXIBLE COPPER EXPANSION CONNECTOR

TECHNICAL DATA...

MATERIAL:

highly flexible, bare copper strand · 0.1 mm · single wire diameter · also available optionally in a tin plated embodiment

CONTACT ENDS:

The connection ends consist of copper sleeves which are pressed on. The copper connectors can be manufactured for any desired current rating.

DRILL HOLES:

Supplied upon request with drilled connecting lugs.

Drill holes in accordance with DIN 43673 sheets 1 and 2 'Busbars - Drill holes and screw fittings', and/or in accordance with DIN 46206, sheet 2 'Connections for electrical operating equipment' or in accordance with drawings and data.

Special embodiments are available upon request.

The max. current load depends on the environmental conditions - The values do not apply to non-clad connectors

PRODUCT SUMMARY...

FOR OVER 60 YEARS EXPERTISE IN:
**ENGINEERING +
MANUFACTURING**

...OF INDIVIDUAL COMPONENTS THROUGH
TO THE COMPLEX HIGH CURRENT SYSTEM

▶ EAF / LF

▶ ELECTRODE ARM TECHNO-
LOGY / HIGH CURRENT LINES

▶ HIGH CURRENT CABLES

▶ SWITCHGEAR

▶ ESR
